What is HPV?

HPV is short for Human Papillomavirus

It is a common virus that affects nearly 80 million people in the United States.

HPV can lead to several health issues and cancers

Infection can lead to development of genital warts and cancers including: cervical, vulvar, vaginal, penile, and head and neck cancers.

Did You Know?

- HPV is a common virus in both men and women
- A person may not know they have the HPV virus until years after they are infected
- HPV can lead to several health issues and cancers
- HPV vaccination can help reduce the risk of developing disease?

Early Vaccination is Key!

When To Get Vaccinated

Pre-Teens

Vaccination can begin as early as 9 years old. Eligible children ages 11 or 12 years old should receive the vaccine for the best immune response

Young Adults

Vaccination is recommended for all up to the age of 26. Early vaccination is encouraged! Those at high risk should speak with their physician

Doses

- A 2-dose series is recommended for between 9-14 years old
- 3 doses are recommended for those 15 years of age and older
